LSTM results report

Multi-pollutant forecasting | 4 November 2026

Dataset: supplied combined hourly CSV with 11 pollutants and 14,592 rows.

Training and validation use 2025. Testing uses January to August 2026.

Daily: hourly forecasts averaged to a day versus a direct daily forecast.

Weekly: daily forecasts averaged to a week versus a direct weekly forecast.

Monthly: weekly blocks averaged to a month versus a direct monthly forecast.

Error = predicted - actual. Each prediction row includes this exact signed error.

Find every prediction and its error in each model folder: results/predictions_2026.csv.

MAE is the average absolute error. RMSE gives larger errors more weight.

Lower MAE and RMSE are better. Compare values within the same pollutant.

Units: CO is mg/m3; NOx is ppb; other pollutants use source micrograms/m3.

Each actual average needs 75% hourly coverage. Missing actuals are not scored.

Forecasts use measurements available before the period starts.

Later 2026 forecasts can use earlier observed 2026 data, without retraining.

Monthly findings are exploratory: only nine direct training windows and eight test months.

One seeded run does not establish superiority. AQI classification is still pending.

Network: one recurrent layer with 32 hidden units; Adam at 0.001; seed 42.

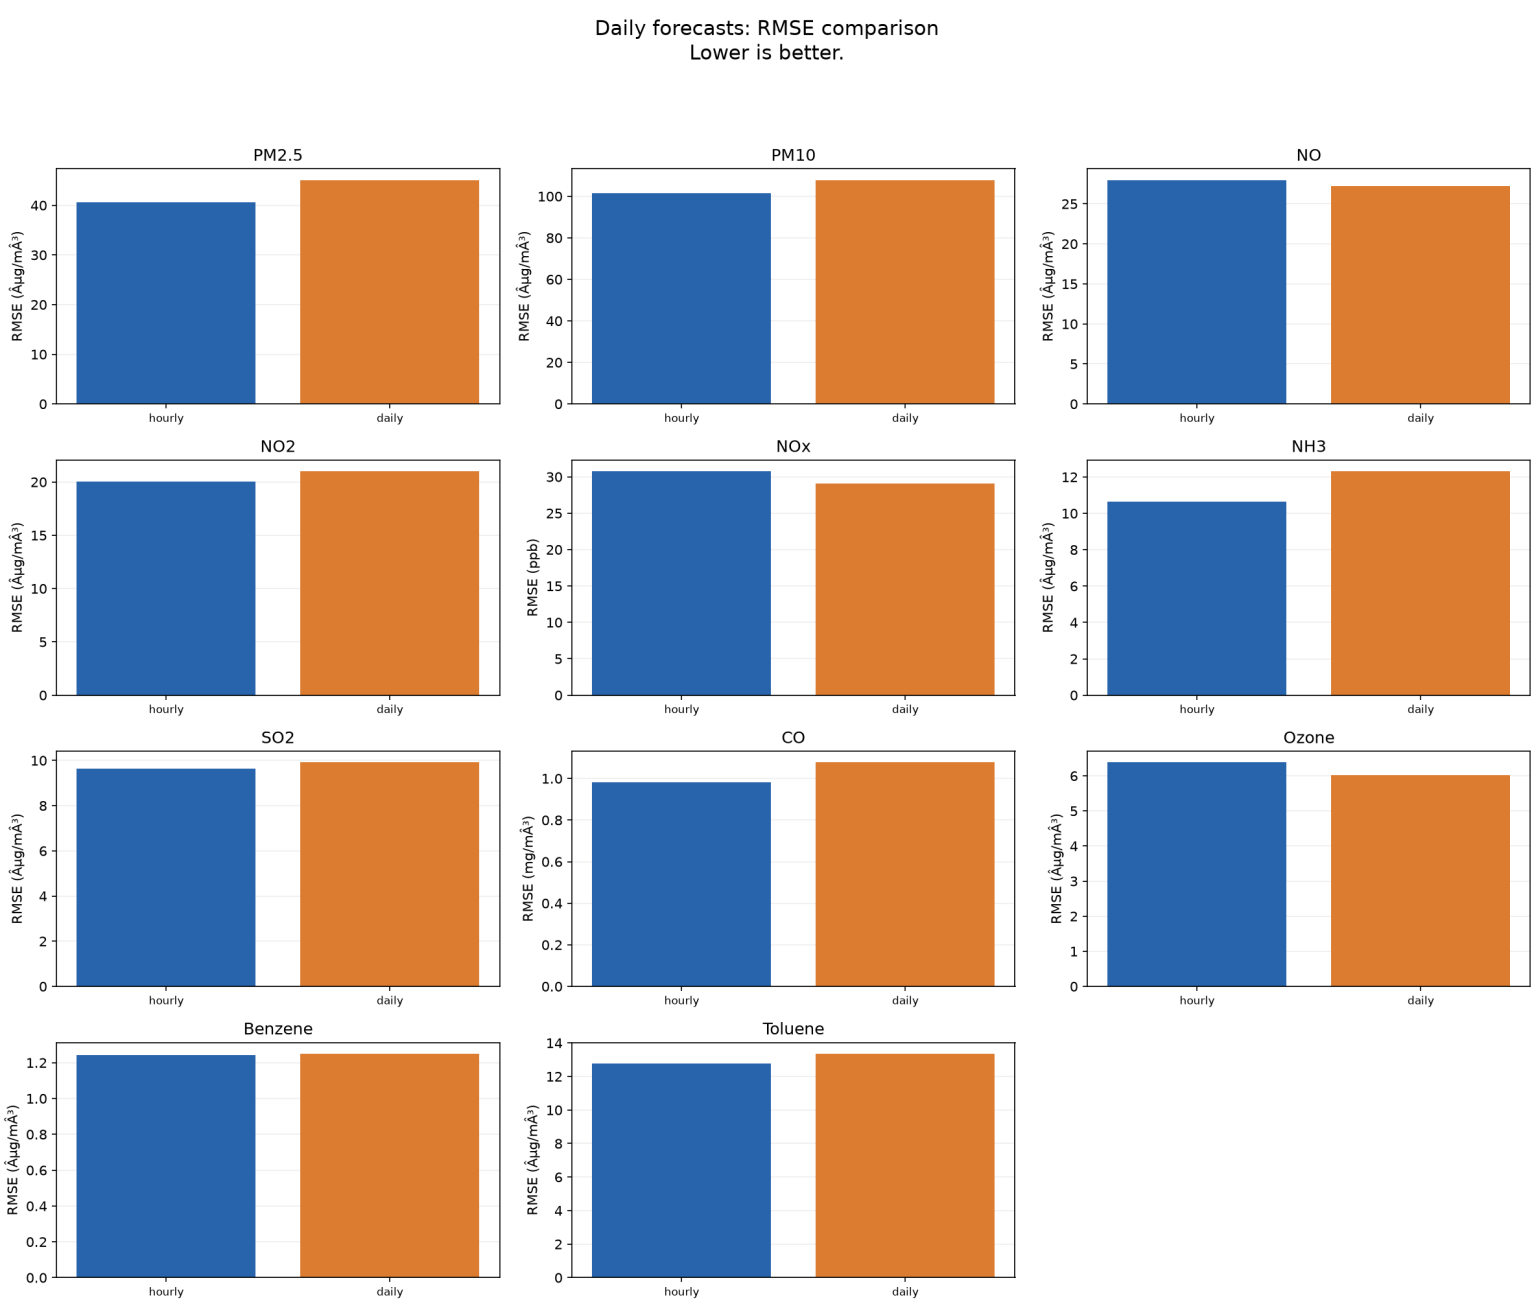

Validate on October-December 2025; select epochs, then refit on eligible 2025 data.

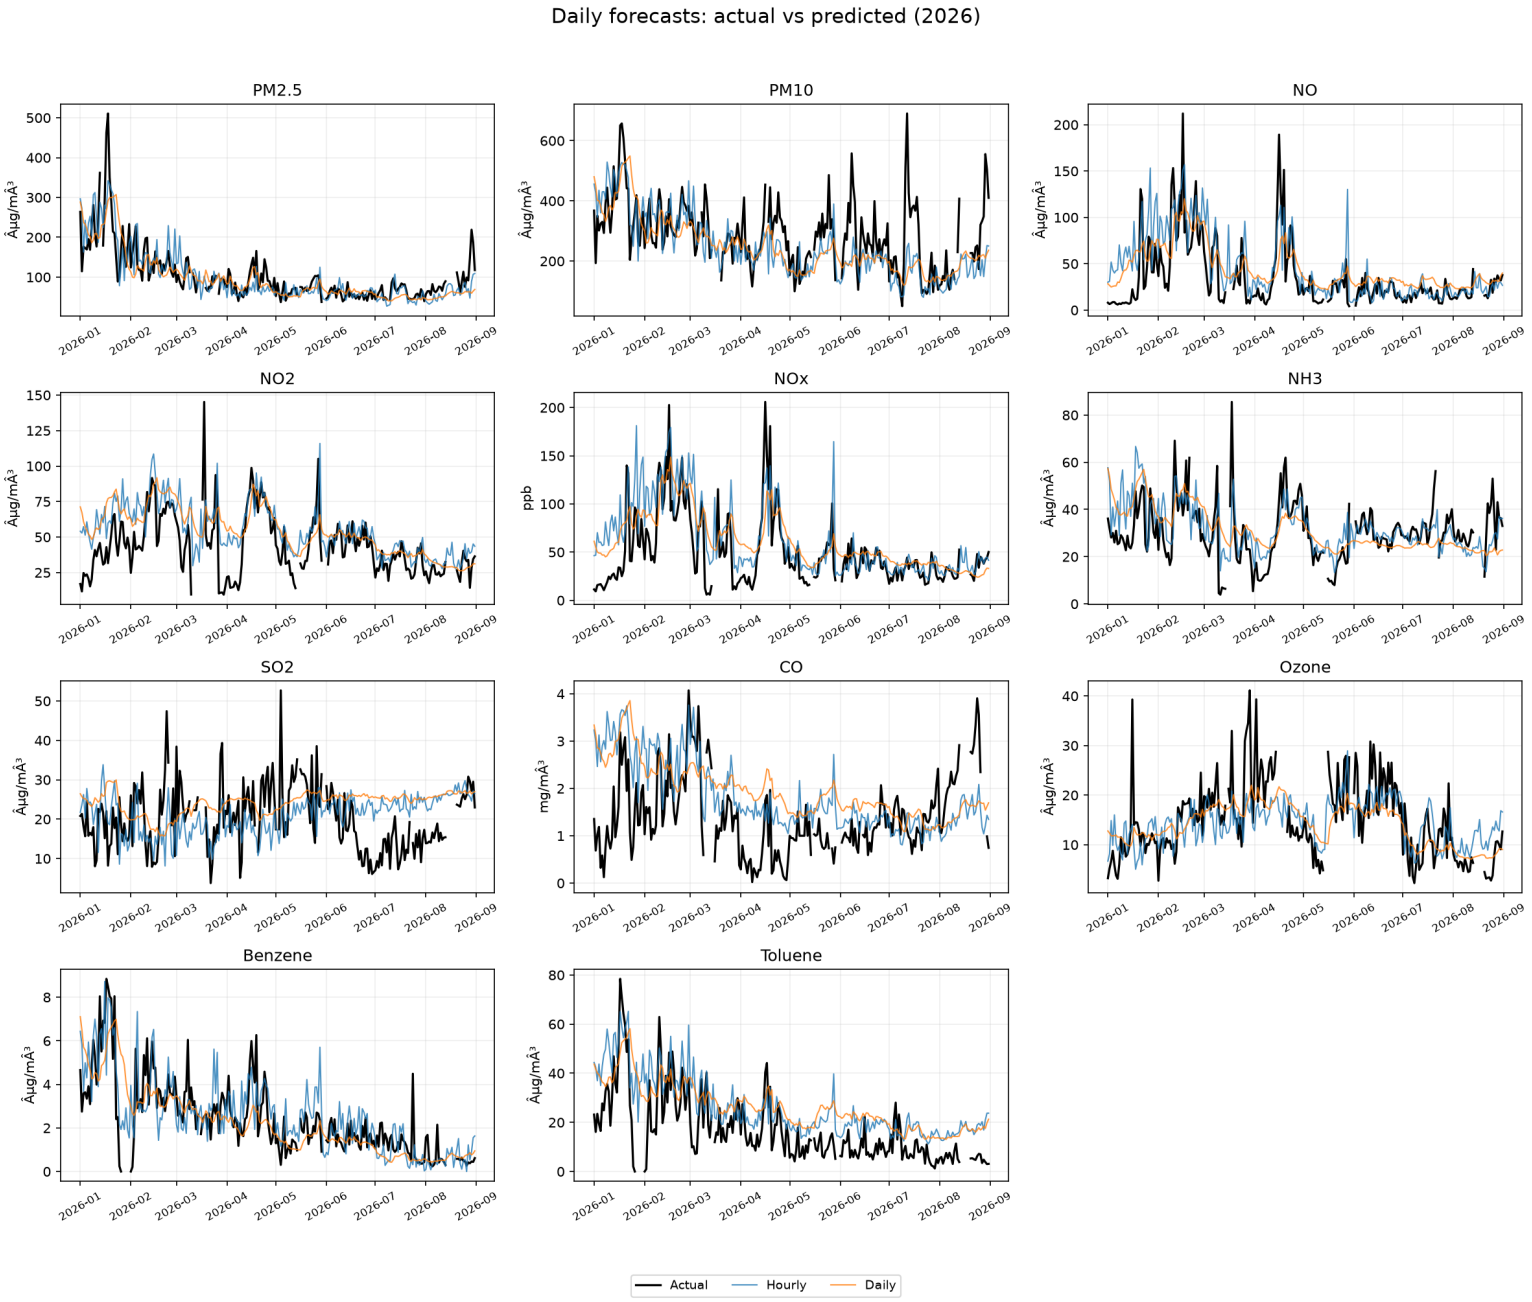

Missing past inputs fill forward or use training medians; scaling uses training data only.

Daily errors

MAE and RMSE in original units. Lower is better. N is the number of scored periods.

Pollutant	N	Daily MAE	Daily RMSE	Hourly MAE	Hourly RMSE
Benzene	229	0.81	1.25	0.93	1.24
CO	228	0.90	1.08	0.79	0.98
NH3	229	9.68	12.32	7.76	10.65
NO	230	20.55	27.25	18.93	27.97
NO2	227	15.78	21.01	15.39	20.07
NOx	231	22.46	29.09	21.27	30.76
Ozone	227	4.44	6.03	4.98	6.38
PM10	227	76.97	107.84	74.46	101.61
PM2.5	228	28.58	45.09	27.94	40.67
SO2	226	8.17	9.91	7.86	9.63
Toluene	229	11.49	13.36	10.86	12.77
